

Sprint 5 Retrospective

Overview

This sprint retrospective aims to evaluate what has been worked on and identify areas for improvement to achieve the team's goals for Release 3. The main objectives of Sprint 5 were to connect the Google Calendar to the mobile application and to elevate the quality of the app by removing bugs and updating the testing suite and software. Additionally, an ongoing development that started in Sprint 5 is the UI navigations/menus and improvements in the testing capabilities of Maestro. In contrast, these ongoing developments will aid in the building blocks of future features. Overall, Sprint 5 was successful in improving testing, documentation, and feature development.

Date	Sunday, 23 March 2025
Team	Bulat-and-Friends
Participants	Marc-Yves Malchev - 40265238 Ryad Alla - 40227731 Joseph Aladas - 40156616 Alimurat Dinc Donmez - 40245310 Nektarios Zampetoulakis - 40211948 Azmi Abidi - 40248132 Bulat Abdullin - 40264963 Alessandro Tiseo - 40262416 Abdullah Taha - 40261146

Retrospective

Start Doing	Stop Doing	Keep Doing
Start coding in pairs with the different members of the team.	Stop skipping UI mock-up documentation. Add more comments to improve documentation and readability for other group members.	Keep improving knowledge surrounding the new and currently used tools (Example: Clarity).
Schedule 6 structured group meetings (9 group members) per week to improve progress and communication.	Stop refactoring the code with the same refactor types. Instead, use different refactor types in Fowler's Catalogue.	Keep producing clear and concise documents with pictures to set up the application.
Create reusable code that can be reused in different locations of the application.	Stop reviewing the code quickly, instead add specific comments to the exact code causing the problem.	Keep performing the bug reports at the same level (Well documented).
Start refactoring in pairs with different members of the team.	Stop focusing too much on the implementation of the feature in the pull requests. Give areas of improvement.	Address important problems early and separate tasks accordingly.
Increase team communication between different parts of the development. (Ex.: Backend Team working with Frontend Team)	Stop believing that other group members have the same understanding of the software you built.	Write crucial test cases that test important functionality.
