

## Sprint 6 Retrospective

### Overview

The purpose of this sprint retrospective is to evaluate what has been worked on and identify areas for improvement to achieve the team's goals for Release 3. The main objectives of Sprint 6 were to add the feature of tracking and information pertaining to the concordia shuttle, indoor directions of the campus and to determine the start building according to the users location. During the implementation of these features, the team ensures the tracking and removal of bugs and updating existing testing suites and refactoring the code to improve the maintainability and readability. Additionally, a development that started in Sprint 5 was improvements in the testing capabilities of maestro. Conversely, in Sprint 6 maestro has undergone the necessary developments. Overall, Sprint 6 was successful in improving on testing, documentation, and feature development.

### Retrospective

| Start Doing                                                                            | Stop Doing                                                                                                                    | Keep Doing                                                                                |
|----------------------------------------------------------------------------------------|-------------------------------------------------------------------------------------------------------------------------------|-------------------------------------------------------------------------------------------|
| Start incorporating different design patterns to the code.                             | Stop believing that other group members have the same understanding of the software you built.                                | Keep improving knowledge surrounding the new and currently used tools (Example: Clarity). |
| Start acquiring more participants to test the product to give feedback.                | Stop hardcoding values without proper documentation.                                                                          | Keep improving the documentation of mockups to enhance readability.                       |
| Start adding more tests to improve test coverage compared to Sprint 5.                 | Stop allowing one or a few team members to start the meeting. Foster every team member to take turns on starting the meeting. | Keep refactoring the code with different refactor types.                                  |
| Start refactoring in pairs with different members of the team.                         | Stop coding in pairs with the same member of the team.                                                                        | Address important problems early and separate tasks accordingly.                          |
| Start scheduling many 1 to 1 meetings with every team member to improve communication. | Stop delaying code reviews. (Perform code reviews at a more efficient level.)                                                 | Keep having PRs with comments directly on the code.                                       |
